

Improving medical workflow &
image processing, evaluation
with the power of AI.

Medical **A**rtificial **I**ntelligence **A**ssistant

Our AI-based software has been improved through interviews and collaboration with more than

50 healthcare professionals*

*with hospital director, specialist and resident

Pre-triage and tasks assigned to doctors would be a great help for us

In some cases, when searching for historical data, we could not find the images in PACS for the written material.

Sometimes, several doctors work on a single finding at the same time and don't even know about it, because until " the medical report is closed, it's not visible.

Reviewing and comparing historical data in one interface would be useful for us, for example, in tumor monitoring.

This workflow management tool would be a great help for us in the CT department even without the AI module!

This interface could facilitate communication between the resident and specialist, and it could also provide feedback on the improvements made by the specialist regarding the resident's findings."

Quality control, statistics, setting and monitoring of KPIs would be very important in this area as well
